

SMART

SERVICE

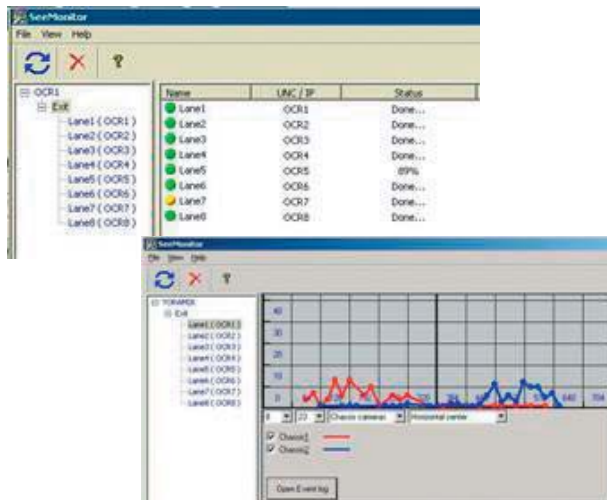

SeeContainer SMART SERVICE Suite

HTS offers a full package of utility programs that enable local and remote internet-based service support and enhance systems operations and performance. The package is available as a complete suite or as individual utility programs.

The benefits of SMART SERVICE Suite include:

Networking: SeeData enables the connections of multiple SeeContainer systems to a central local or remote server using standard TCP/IP protocol, enabling the integration and data-sharing of all site OCR systems.

Status and Diagnostics: SeeMonitor utility applications capture and report on the operation, performance and recognition rates of each SeeContainer system and its components. Alarm conditions may also be reported to external services.

Maintenance: SeeMonitor applications enable remote or local service personnel to monitor, troubleshoot, repair and maintain SeeContainer systems. SeeService applications ensure that all installed systems are running on updated and correctly installed application versions.

Control and Automation: Control and automation applications can follow the sequenced activity of SeeGate, SeeTruck and SeeCrane output to produce enhanced output OCR confidence, utilizing special database matching programs.

Profiling and Operations Tracking: Profiling and operations tracking applications monitor operations parameters such as truck plate origin, traffic patterns and crane or train operations. These applications can then yield more customized and optimized performance for end users.

Upgrades: Upgrade applications augment the performance of the SeeContainer systems, implementing enhancements collected from system installations worldwide. They also prevent problems with version control, and hardware and software platform obsolescence.
